

Hacking MotionBuilder: 10* things you aren't doing but should be!

Brad Clark

Co-Founder @ Rigging Dojo

Teaching the Art and Science of Character Rigging

Session Running Time (20 min): Twitter QA #hackmobu

About me

15 years production and training experience with a focus on Character Rigging, Performance capture, Animation and Mentoring.

Mix master - Effortless Animation

Stop Brute force editing and make it animator friendly.

Problem:

Animators often feel a lack of control over poses, timing and resort to deleting keys or brute force baking or trying to key it from scratch.

Fix:

Hand pick KEY poses from the capture, mixing between them as needed using a trick of override layers and blend weight.

Story tricks - quick mix

Problem:

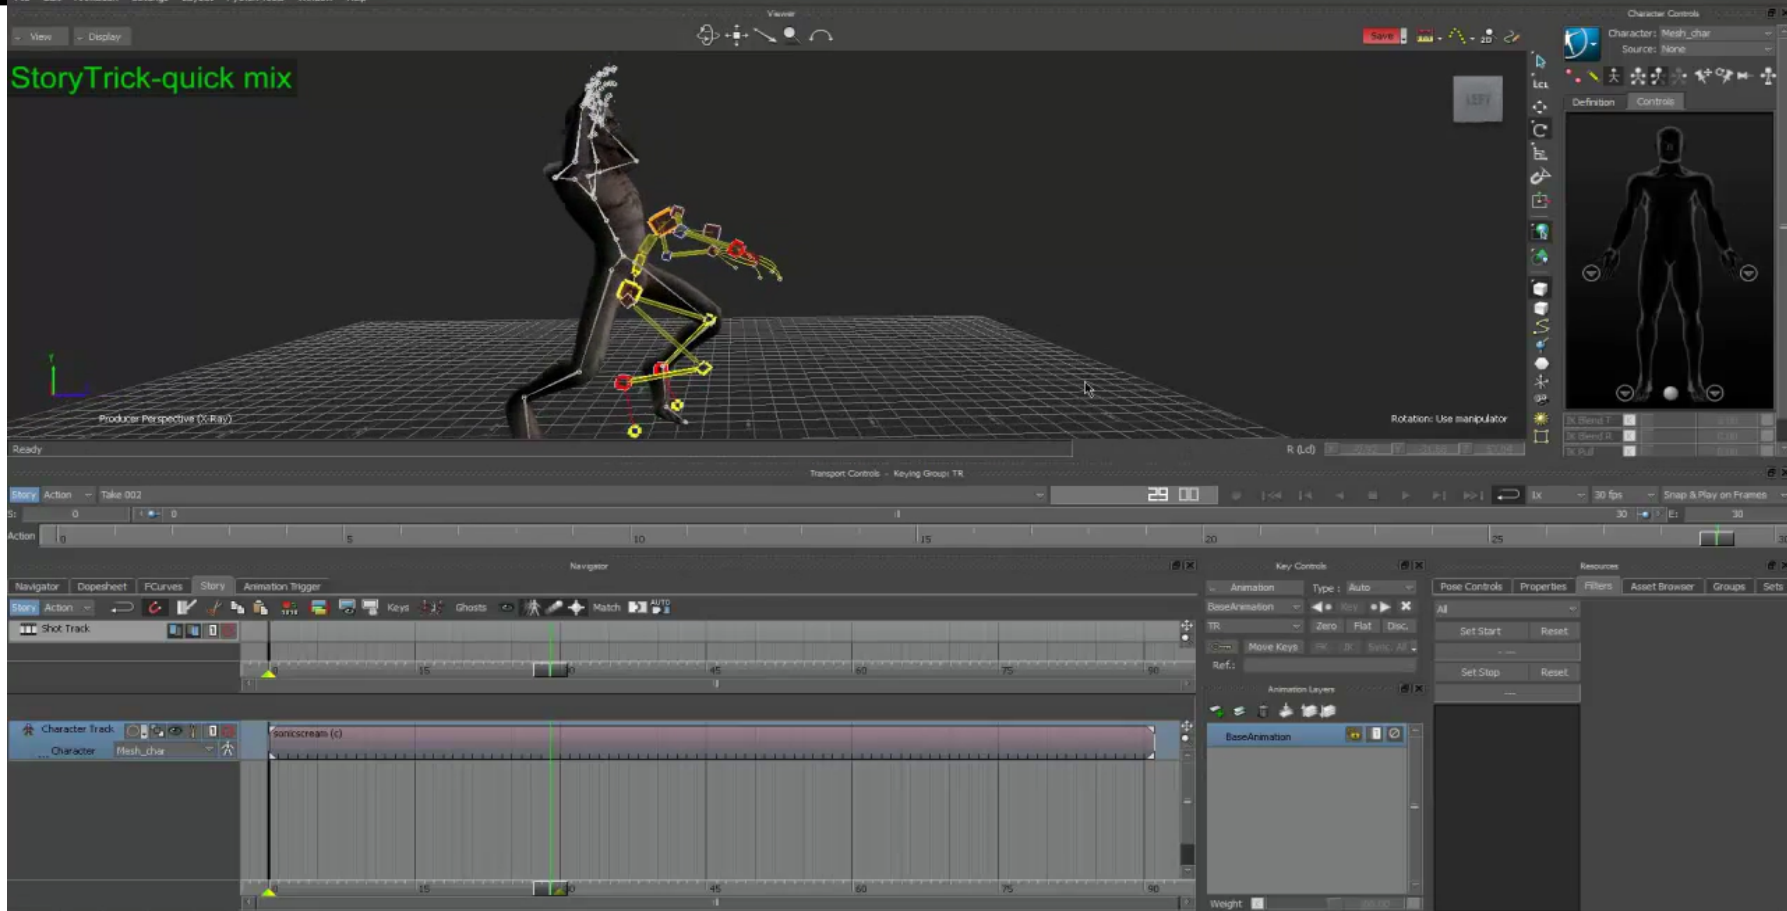

Many animation cycles need to have one base move like a run with several different upper body moves.

Fix:

Using story character tracks filtered by body part, our motion clip will combined with the current take.

This quickly create new moves with less work and fuss.

Painless Motion Mirror tricks

Problem: Having only a Left animation, we need mirror it and create a Right version but have it end in a non-mirrored pose. **Avoid 3 days. doing this by hand.*

Fix:

Take advantage of the control rig behavior, pose tool and animation layers for a quick paste and blend trick to save literally days of work.

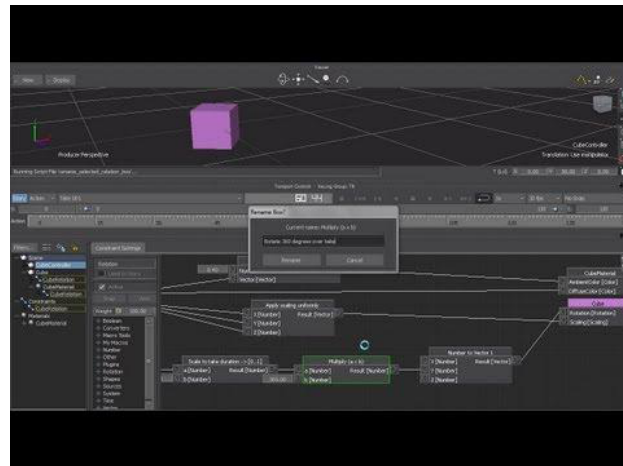

Script first aid kit!

While you might be able to work in MotionBuilder without scripts, you shouldn't.

Here are a few a TD should always have.

- Max artists: Freeze joint orient
- Rename relation boxes -
 - From Alex Forsythe -download-
- Save character definition*
- Transfer character animation to a zero frame CharTimeToZero
- Non-destructive foot pin script
 - (two slides away...)

UI! Infinite Monkey engine

Problem: Character control picker lacks quick access to toes

Fix:

Hack it, this is an XML file and easy to improve

Warning- can lead to lots of monkeying with the UI

Ref:

Powerful Feet controls fast

Simple foot control for better animation. Living without a reverse foot.

Problem:

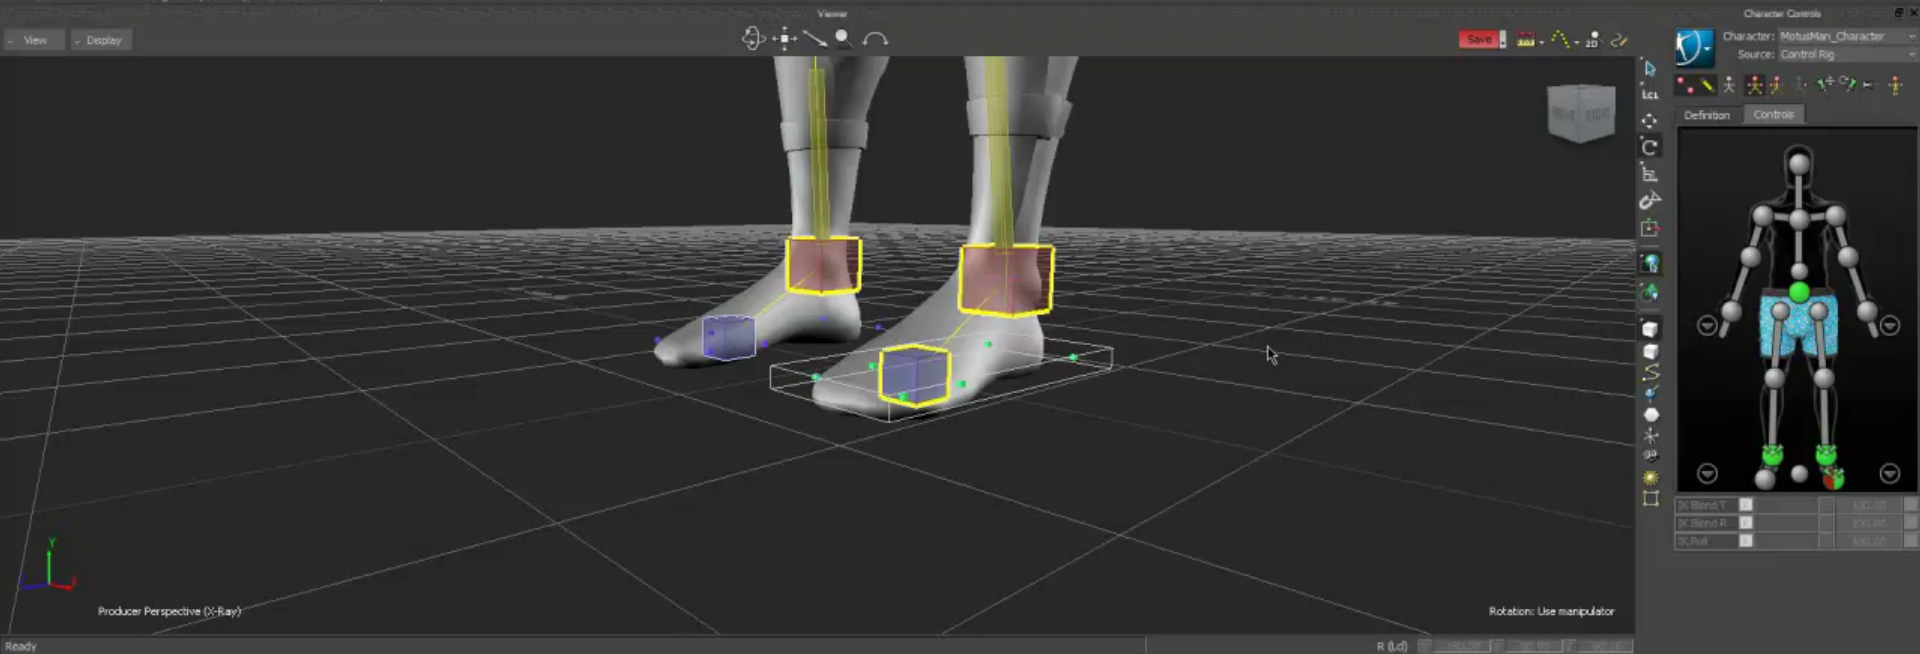

Overwhelmed animators trying to managing the pining, aux controls and reach settings

Fix:

Leaving the feet pinned and using Handel, constraint and default tools for faster work animating feet on the base rig.

**some interpolation issues can still occur*

Punch up the curves

Problem:

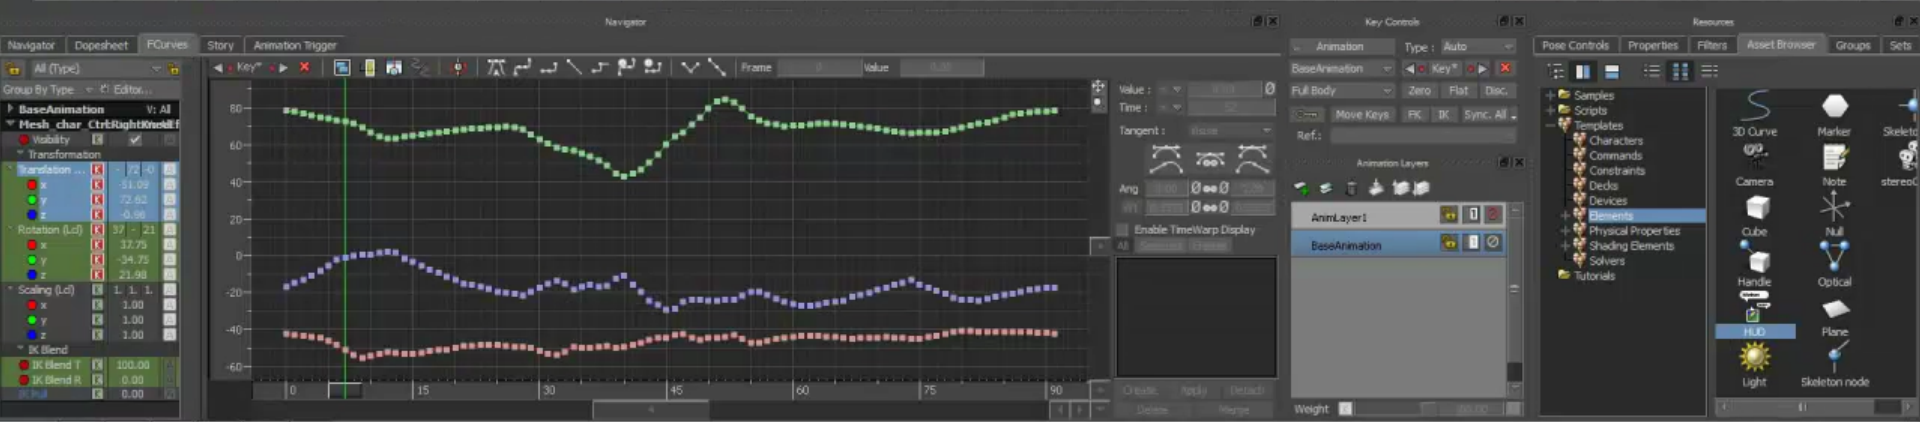

Filtering curves that are noisy creates smooshy curves, and Mas Oyama doesn't like smooshy.

Fix:

Butterworth your curves on the IK controls, this isn't new Buffer curves first then filter is.

This lets animators A/B compare, get better results and and not lose important performance.

Non-destructive foot lock

Problem:

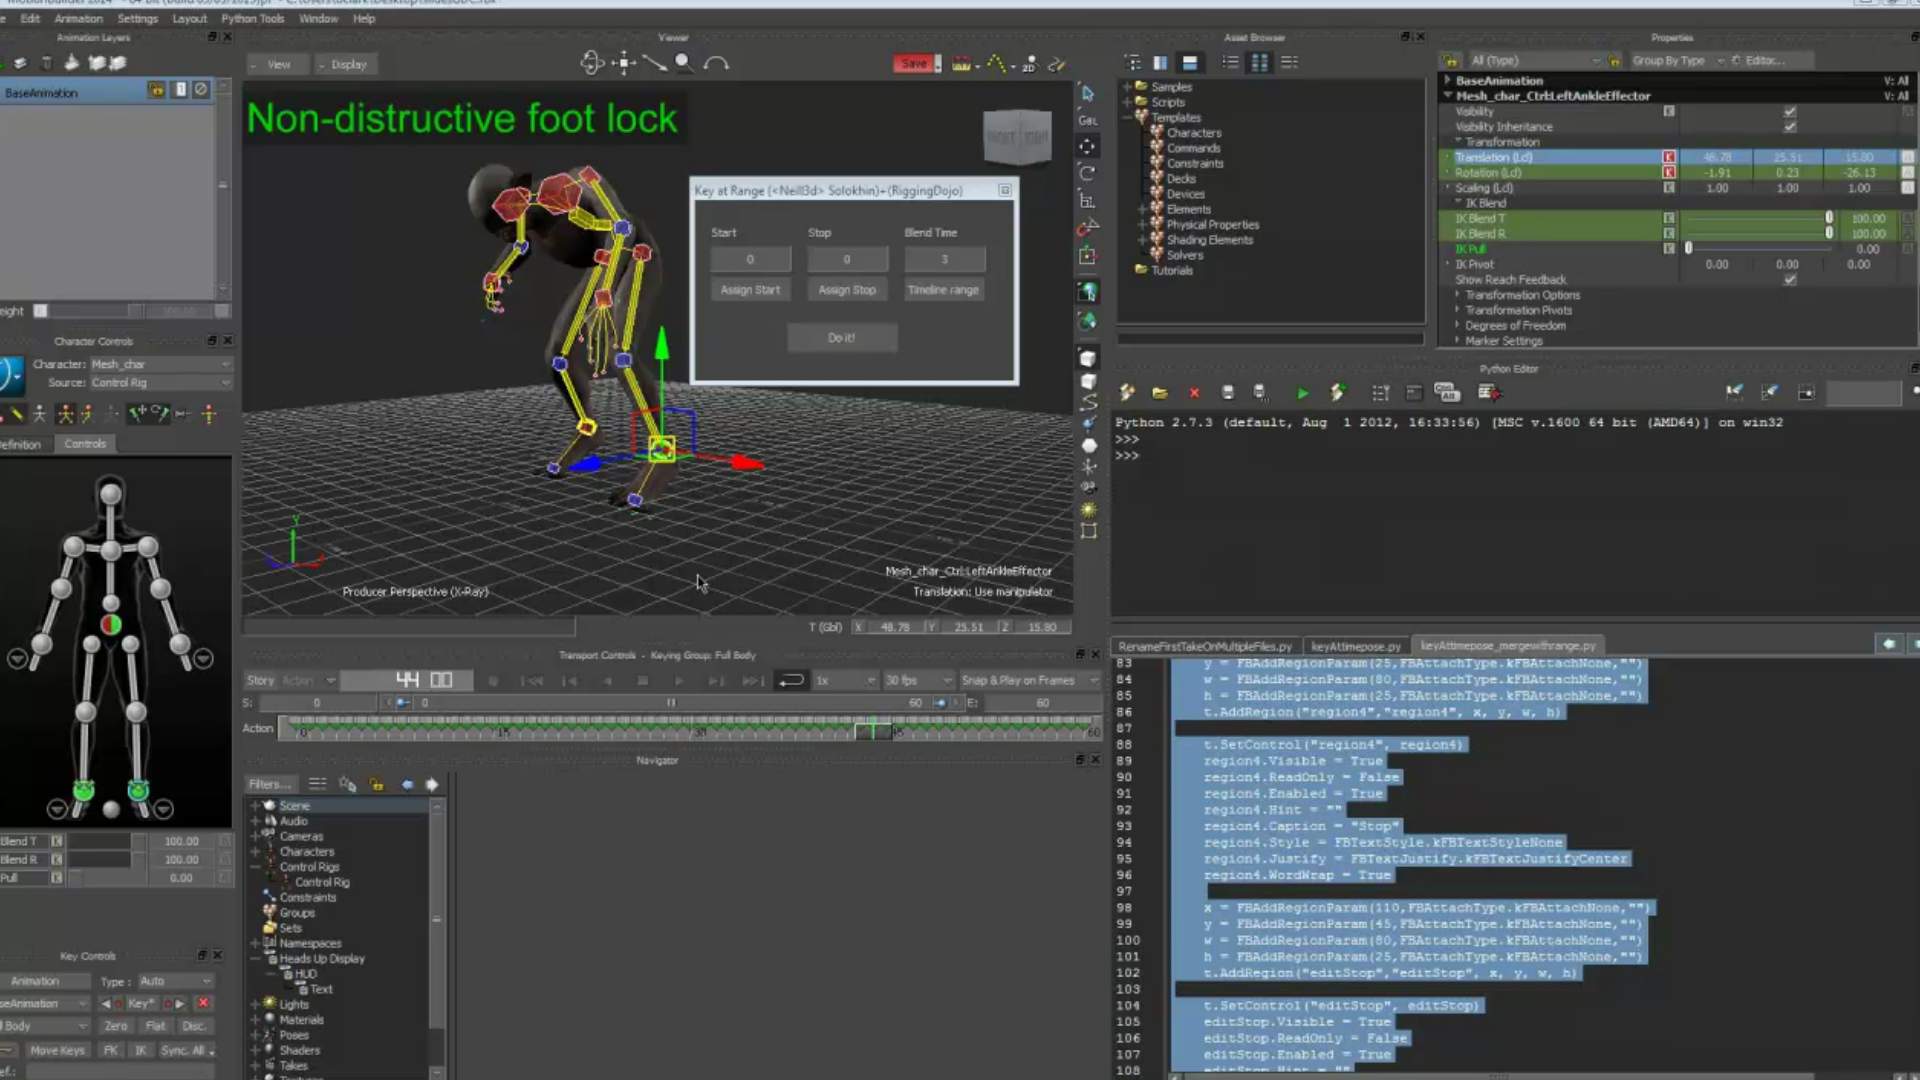

Key at time technique is slow due to hand typing frame numbers

Fix:

Script it!

Non Destructive version of StayOnFloor_2013
from [://neill3d.com...scripts-for-motionbuilder](http://neill3d.com...scripts-for-motionbuilder)
*updated by me

Pseudo Auto Rigging: no scripting

Problem:

Transferring custom rigs to a new character can be difficult, animators won't use the custom rig if they can't get back to it quickly.

Fix:

Using the character menu - the load animation function will let us load just the rig on to new character. Saving custom xml maps get you characterized fast.

Pseudo Auto Rigging
