Session: Context

- Still a lot of confusion and misunderstanding about PBR
- A lot of PBR learning material not very `artist friendly'
- Completely new approach to the way we think about how we author our content

1. Understanding PBR

GAME DEVELOPERS CONFERENCE March 14–18, 2016 · Expo: March 16–18, 2016 #GDC16

What is PBR?

As the name suggests, physically-based rendering (PBR) is a method of shading & rendering, used in order to provide a more accurate representation of the real (physics-based) world around us.

Why bother to learn the science?

 As artists it's important for us to understand how light interacts with surfaces in order for us to be able to realistically re-create this within our own content.

Better understanding = Better content

Key Concepts of PBR

- 1. Specular and Diffuse Reflection
- 2. Microfacet Theory
- 3. F0 Reflectance
- 4. Energy Conservation

Base Color (Albedo)

- Devoid of lighting information *exception micro-occlusion
- No dark values below 30 sRGB (50 sRGB strict mode)
- No bright values above 240 sRGB

Metal Reflectance Values Base Color & Metallic

- 70-100% specular (180-255 sRGB)
- Some metals can be corroded
- Painted or coated metal is dielectric
- Dielectric layer affects metallic map examples: dirt and rust

3. Troubleshooting Physically-Based Scenes

Summary

1. Understanding PBR:

- Many great benefits to using PBR, but we must fully embrace it and its rules in order to truly get the best out of it.
- In order for us to do this, its crucial that we spend some time looking at the basic scientific theories and principles which underpin PBR, as the better our understanding is – the better our content will become.

Summary

2. Authoring Workflow & Guidelines:

- Base Color is devoid of lighting info and no dark values below 30 sRGB or bright values above 240 sRGB
- Metal reflectance is 70-100% specular (180-255 sRGB) and the metallic map values are mainly binary (black or white).
- The roughness map is the most creative map to author. You can't go wrong here. White = rough and black = smooth.

Summary

3. Troubleshooting Physically-Based Scenes

- PBR materials can often miss-direct us about the roots cause of issues in our scene
- When objects are not behaving as expected, investigate the material properties before adjusting other elements such as lighting or reflections.
