Mark Pauly
ETH Zurich

Figure 1: A 3D shadow art sculpture that simultaneously casts three distinct shadows. The side columns show the desired shadow image provided by the user (left), inconsistencies due to conflicting shadow constraints (middle), and optimized images (gray) that avoid shadow conflicts with the outline of the original for comparison (right).

Abstract

“To them, I said, the truth would be literally nothing but the shadows of the images.” - Plato, *The Republic*

Shadow art is a unique form of sculptural art where the 2D shadows cast by a 3D sculpture are essential for the artistic effect. We introduce computational tools for the creation of shadow art and propose a design process where the user can directly specify the desired shadows by providing a set of binary images and corre-

2D shadows and the fact that many different shapes can cast the same shadow are instrumental in the classical hand shadows and other forms of storytelling such as ancient Chinese shadow puppetry [Ewart 1998].
