Physically-Based Reflectance for Games

Siggraph 2006 Course

Wolfgang Hoffmann Dan Babbitt Jan Kautz

Course Description

This course discusses the practical implementation of physically-principled reflectance models in interactive graphics and video games, in current practice as well as upcoming technologies. The course begins with the visual phenomena important to the perception of reflectance in real-world materials, which it uses as background for the underlying theory and derivation of common reflectance models. After introducing the current game development pipeline, from content creation to rendering, the course then discusses rendering techniques for implementing reflectance models in games — with emphasis on real-world trade offs such as render performance, content creation efficiency, resource allocation considerations, and overall rendering quality. The course will help a researcher understand constraints in the game development pipeline and it will help a game developer understand the physical phenomena underlying reflectance models.

Syllabus

- 8:30 - 9:40 Introduction (Wolfgang Hoffmann) [PBR]
 - Motivation
 - Problem Statement
- 9:40 - 10:15 Reflectance (Wolfgang Hoffmann) [PBR]
 - Types of Reflectance
 - Reflectance Theory
 - Reflectance Model Foundations
- 10:15 - 10:45 Game Development (Wolfgang Hoffmann and Dan Babbitt) [PBR]
 - Game Platform
 - Computation and Storage Considerations
 - Production Considerations
 - The Game Rendering Environment
- 10:45 - 10:50 Break
- 10:50 - 11:15 Reflectance Rendering with Point Lights (Wolfgang Hoffmann and Dan Babbitt) [PBR]
 - Analytical BRDFs
 - Other Types of BRDFs
 - Anti-Aliasing and Level-Of-Detail
- 11:15 - 12:00 Reflectance Rendering with Environment Map Lighting (Wolfgang Hoffmann) [PBR]
 - Environment Maps
 - Theory of Filtered Environment Maps
 - Diffuse Filtered Environment Maps
 - Glossy Filtered Environment Maps
 - Anti-Aliasing for Environment Map Rendering
 - Precomputed Radiance Transfer
- 12:00 - 12:15 Conclusions/Summary (Wolfgang Hoffmann) [PBR]
 - Summary
 - Q&A
 - References [PBR]
 - Glossary [PBR]

Status of PBR

Content

1. What is PBR

2. The influence of PBR

```
float LightingFuncGGX_OPT5(float3 N, float3 V, fl
{
    float3 H = normalize(L)
    float dotNL = saturate(dot(N, L));
    float dotLH = saturate(dot(L, H));
    float dotNH = saturate(dot(N, H));

    float D = g_txGg.V.Sample(nearClip,
    float2 FV_helper
        g_txGgxDFV.Sample(p, I, float2

    float FV = F0*FV_helper.x + FV_helper.y
    float specular = dotNL*FV

    return specular;
}
```

Background knowledge

Seeing is believing?

Seeing is believing?

Visible light range: 400 nm - 700 nm

What is PBR

Differences between PBR and traditional rendering

Essence: subjective and objective

PBR: Based on the physical properties of the things in the objective world

Traditional rendering: Based on the viewer's subjective image

Style: "process-oriented" vs "result-oriented"

PBR: Decompose a complex phenomenon into a series of formulas and parameters associated

Traditional rendering: focus on final result

Function: “all-weather” vs “single angle”

PBR: it can always adapt to the environment.

Traditional rendering: from a certain perspective, unable to take the overall situation into account

PBR

Traditional rendering

Details of PBR

1. Physically Based Lighting
2. Physically Based Shading
3. Physically Based Sensitising

Physically Based Lighting

Three elements of lighting (to discuss PBL from the perspective of artist):

1. Intensity
2. Color
3. Type

Lighting intensity

Three common physical units

1. Candela

2. Lumen

3. Lux

Steradian, symbol: sr

1. Unit of solid angle
2. Any closed sphere' s solid angle is 4π

Candela, symbol: cd

1. Unit of visible light intensity ($1/683\text{W/sr}$)
2. A common candle emits light with a luminous intensity of roughly one candela.

Lumen, symbol: lm

1. Unit of luminous flux
2. 1 lumen (lm) = 1 cd • sr
3. The luminous flux of a common candle is about lumens (220v)

Lux, symbol: lx

1. Unit of luminous flux (Illuminance)
2. 1 lux= 1 lumen/square meter

Attenuation

Inverse-square law: Light intensity is inversely proportional to the square of distance and attenuates (energy conservation)

Scattering

Light is forced to deviate from a straight trajectory by one or more paths due to localized non-uniformities in the medium through which it passes.

Mie scattering

Condition o: particle radius $\geq$ wavelength of the incident light

空气中的微粒

Mie scattering is as follows:

1. Most of the incident lights will scatter along the forward direction
2. particle radius will change the model of Mie scattering

Particle radius is close to the wavelength of the incident light

Particle radius increases

Impact on outdoor natural light intensity

weather	Transmissivity	Sky light
Sunny	About 0.85	10000 lux
Cloudy	About 0.55	1000 lux

IES LIGHT

Photometric profile

IES : illuminating engineering society

IES Light = Maximum intensity (candela) X IES Photometric profile

Mastercolor

日光型螢光燈	6500 °K
正午日光	5500 °K
電子閃光燈	5500 °K
早晨或下午陽光	4000 ~ 5000 °K
攝影棚燈光	3000 ~ 4000 °K
石英燈	3500 °K
鎢絲燈泡	2700 ~ 3200 °K
黎明、黃昏	2000 ~ 3000 °K
燭光	1800 ~ 2000 °K

▲ 常見的環境色溫

Rayleigh scattering

Condition: Particle radius $\leq$ One tenth of the wavelength of incident light

Rayleigh scattering

Scattering intensity: inversely proportional to the fourth power of the wavelength

瑞利散射发生时，阳光中各波长的光所占比例

Lighting type

1. directional light

2. Punctual light

3. area light

Punctual light VS Area light

	Specular	shadow	instance
Punctual light		Source Occluder 	
Area light		Area Source Occluder 	

brief summary of PBL

Physically Based Shading

Shading: material response to lighting

Function: BRDF

BRDF 是什么

Bidirectional Reflectance Distribution Function

1. Bidirectional
2. Reflectance
3. Distribution Function

Bidirectional (双向)

1. The direction from sampling point to camera (eyes)
2. The direction from sampling point to point light source

Reflectance (反射率)

$$\text{Reflectance} = \text{Radiance} / \text{irradiance}$$

Irradiance (power/area) : the power of the light received by current point

Radiance (power/(area x solid angle)) : the power of the light emitted by current point

Distribution Function

Three different types of BRDF

Empirical model	Physically based model	Data-driven mode
 The diagram illustrates the Phong Model, an empirical BRDF. It shows three components on the left: a white sphere labeled 'Diffuse', a blue sphere labeled 'ambien t' (with a typo), and a sphere with a white-to-blue gradient labeled 'specular'. These are separated by plus signs. Below the 'Diffuse' sphere is the text 'Phong Model' in red. An equals sign follows, leading to a single blue sphere on the right, representing the final result of the model.		 This section shows a data-driven approach to BRDF modeling. On the left is a large, black, industrial-grade measurement goniometer. To its right are several overlapping screenshots of software interfaces. These interfaces display various visualizations, including color spheres, graphs, and data plots, which are used to capture and process real-world light reflection data.

Basic principles of physics-based model

1. Reciprocal

2. Conservation of energy

3. Constant positive (Positivity)

Generic Shader

$$C_i = K_a * \text{ambient}() + K_d * \text{diffusion}() + K_s * \text{specular}()$$

1. Ambient
2. Diffusion
3. Specular

Traditional RSL shader

RSL2.0 shader

Modern RSL2.0 PB shader

www.renderstory.com

Picture from : Naty Hoffman, Background: Physics and Math of Shading

Diffusion

The process of diffusion:

1. Refracting into a material
2. Scattering in the material
3. Scattering out from the material

Diffusion model

1. Lambert : Based on smooth material surface.

Lambert model characteristics: :

Isotropic (camera view)

Light intensity distribution is in line with the cosine law (light angle)

$$F_{\text{lambert}} = \frac{\rho}{\pi}$$

$$F_{\text{lambert}} = \frac{\rho}{\pi} \cdot E_o \cdot \cos \theta_i$$

2. Oren-Nayar

derived from Lambert model

extended to the rough surface

controlled by roughness(0-1.0)

Theoretical basis of Oren-Nayar model

Based on microfacet model theory

Composed of many microfacets

Every facet can be seen as a Lambert reflection plane

Oren-Nayar formula

$$F_{Oren-Nayar} = \frac{\rho}{\pi} \cdot E_o \cdot \cos \theta_i (A + (B \cdot \max[0, \cos(\phi_i - \phi_r)] \cdot \sin \alpha \cdot \tan \beta))$$

$$A = \frac{1}{\pi} \left(1 - 0.5 \frac{\sigma^2}{\sigma^2 + 0.33} + 0.17 \rho \frac{\sigma^2}{\sigma^2 + 0.13} \right)$$

$$B = \frac{1}{\pi} \left(0.45 \frac{\sigma^2}{\sigma^2 + 0.09} \right) \quad \sigma : \text{roughness}$$

$$F_{Lambert} = \frac{\rho}{\pi} \cdot E_o \cdot \cos \theta_i$$

$$F_{Oren-Nayar} = \frac{\rho}{\pi} \cdot E_o \cdot \cos \theta_i \cdot \text{粗糙因子}$$

$$F_{Oren-Nayar} = F_{Lambert} \cdot \text{粗糙因子}$$

当 $\sigma = 0$:

$A=1$, $B=0$, 粗糙因子 = 1

Lambertian

Oren-Nayar

Images by Pharr and Humphreys [Physically Based Rendering, Morgan Kaufmann/Elsevier, 2004]

what is ρ

ρ = Albedo

$$F_{Oren-Nayar} = \frac{\rho}{\pi} \cdot E_o \cdot \cos \theta_i (A + (B \cdot \max[0, \cos(\phi_i - \phi_r)] \cdot \sin \alpha \cdot \tan \beta)) \quad F_{Lambert} = \frac{\rho}{\pi} \cdot E_o \cdot \cos \theta_i$$

Physical meaning of Albedo:

A ration of solar radiation reflected by the object to solar radiation received

Sample albedos

Surface	Typical albedo
Fresh asphalt	0.04 ^[2]
Worn asphalt	0.12 ^[2]
Conifer forest (Summer)	0.08, ^[3] 0.09 to 0.15 ^[4]
Deciduous trees	0.15 to 0.18 ^[4]
Bare soil	0.17 ^[5]
Green grass	0.25 ^[5]
Desert sand	0.40 ^[6]
New concrete	0.55 ^[5]
Ocean ice	0.5–0.7 ^[5]
Fresh snow	0.80–0.90 ^[5]

Albedo definition by rendering engine:

1. Not affected by additional information of lighting (specular, ambient light, shadow)

2. Not affected by exposure bias

3. Not affected by color temperature deviation

sunny

cloudy

tungsten

fluorescent

flash

Two kinds of Albedo texture acquisition

color checker

To calibrate diffuse albedo from reference?

Equipment requirement:

A digital camera which supports RAW format (CPL filter, when necessary).

A 50 mm micro lens is recommended.

A standard Macbeth color-checker

Original

After Lens and Colour Correction

Cross-polarized lighting with spectralon

Specular:

Cook - Torrance reflection model:

microfacet theory:

1 . The surface is composed microfacets, every facet only does specular reflection

2 .

2 . Based on microfacet normal M , every facet only reflects the light of single direction

数学公式:

$$F_{Cook-Torrance} = \frac{D() \cdot G() \cdot F()}{4(l \cdot n)(v \cdot n)}$$

Molecule:

D () : Distribution function

G () : Geometry attenuation
function

F () : Fresnel function

Denominator:

4 (n.l) (v.n) : Correction factor for conversion between micro mirror surface and the overall surface

Influences from microstructure of the material surface:

Roughness:

Value range between 0-1

Square root of slope of facet

Half Vector:

The angle between the hvector bisecting the incident light I and observation direction v .

Only when h coincides with the facet's normal M , the microfacet will be "activated."

Picture from : Naty Hoffman, Background: Physics and Math of Shading

Distribution function $D()$:

Normal distribution probability of activated facets

The performance of distribution function with different roughness (GGX)

Geometry attenuation function $G()$:

Distribution probability of facet blocking incident light and reflected light

Picture from : Naty Hoffman, Background: Physics and Math of Shading

Physical meaning

The performance of geometry attenuation function with different roughness (GGX)

GGX (Trowbridge-Reitz) :

$$D_{GGX}(\mathbf{m}) = \frac{\alpha^2}{\pi((\mathbf{n} \cdot \mathbf{m})^2(\alpha^2 - 1) + 1)^2}$$

Beckmann :

$$D_{Beckmann}(\mathbf{m}) = \frac{1}{\pi\alpha^2(\mathbf{n} \cdot \mathbf{m})^4} \exp\left(\frac{(\mathbf{n} \cdot \mathbf{m})^2 - 1}{\alpha^2(\mathbf{n} \cdot \mathbf{m})^2}\right)$$

Blinn-Phong :

$$D_{Blinn}(\mathbf{m}) = \frac{1}{\pi\alpha^2} (\mathbf{n} \cdot \mathbf{m})^{\left(\frac{2}{\alpha^2} - 2\right)}$$

Cook-Torrance:

$$G_{Cook-Torrance}(\mathbf{l}, \mathbf{v}, \mathbf{h}) = \min\left(1, \frac{2(\mathbf{n} \cdot \mathbf{h})(\mathbf{n} \cdot \mathbf{v})}{\mathbf{v} \cdot \mathbf{h}}, \frac{2(\mathbf{n} \cdot \mathbf{h})(\mathbf{n} \cdot \mathbf{l})}{\mathbf{v} \cdot \mathbf{h}}\right)$$

Kelemen:

$$G_{Kelemen}(\mathbf{l}, \mathbf{v}, \mathbf{h}) = \frac{(\mathbf{n} \cdot \mathbf{l})(\mathbf{n} \cdot \mathbf{v})}{(\mathbf{v} \cdot \mathbf{h})^2}$$

Schlick-Beckmann:

$$k = \alpha \sqrt{\frac{2}{\pi}}$$

$$G_{Schlick}(\mathbf{v}) = \frac{\mathbf{n} \cdot \mathbf{v}}{(\mathbf{n} \cdot \mathbf{v})(1 - k) + k}$$

Distribution function (D)	Geometry attenuation function (G)
Blinn-Phong	Implicit
Beckmann	Neumann
GGX	Cook-Torrance
GGX (Anisotropic)	Kelemen

Anisotropic

Anisotropic	Isotropic
Real World: The Microstructure of material surface shows a directional arrangement, more common in artifacts Mathematical model: The distribution of microfacet normal is regular Appearance: The performance of specular is different at different directions, spot shape is stretched	Real World: The Microstructure of material surface is irregular, more common in natural things Mathematical model: The distribution of microfacet normal is random Appearance: The performance of specular is same at different directions, spot shape is circular
  Anisotropic	  Isotropic

Specular Occlusion & Cavity

Specular Occlusion

1. To solve the "leakage" problem
2. Non-PBR

Specular Occlusion realization

1. realization with AO map
2. Camera, normal direction associated
3. Controlled by Roughness

```
float computeSpecOcclusion(float NdotV, float AO, float roughness)
{
    return saturate(pow(NdotV + AO, roughness) - 1 + AO);
}
```

Listing 26: Function for computing specular occlusion for a given roughness.

When the roughness is minimum, the intensity is 50% of AO intensity

When the roughness is maximum and the viewing angle coincides with the normal, the intensity is 100% of AO intensity

When the viewing angle is at 90 degrees to the normal, the intensity is zero

Cavity

Cavity's role

Simulation of recessed hole formed by microstructure
Non-PBR

Differences between Cavity and Specular Occlusion:

cavity	Specular occlusion
Small range, only affects the recessed hole formed by microfacet structure. The intensity is between 0-0.5, irrelevant with roughness	Big range, relevant with the object shape and structure. The intensity is between 0-1, controlled by roughness
Affects both direct specular and indirect specular	Only affect indirect specular

Influences from the material :

Metallicity:

nonconductor = 0 , conductor= 1:

When Metallicity = 1 :

1. No Diffusion, Only Specular
2. albedo = specular color

Reflectance and Fresnel:

Reflectance:

what is F_0 :

the percentage of specular from the incident light

the viewing direction(V) coincides with the normal(N) and incident light(L)

How to get F0:

Non conduction:

based on IOR
range:0.02-0.06

$$F_0 = \frac{(1 - IOR)^2}{(1 + IOR)^2}$$

Schlick function

conduction:

index of refraction is variation
specular color = index of refraction
range:0.65-0.95

TABLE 18.1 Indices of refraction

Medium	n
Vacuum	1.00 exactly
Air (actual)	1.0003
Air (accepted)	1.00
Water	1.33
Ethyl alcohol	1.36
Oil	1.46
Glass (typical)	1.50
Polystyrene plastic	1.59
Zircon	1.96
Diamond	2.42
Silicon (infrared)	3.50

Fresnel:

the observation that things get more reflective at grazing angles.

Fresnel function $F()$:

Variable: the angle(R)
Initial value : F_0
Description reflectance

Schlick :

$$F_{Schlick}(\mathbf{v}, \mathbf{h}) = F_0 + (1 - F_0)(1 - (\mathbf{v} \cdot \mathbf{h}))^5$$

Cook-Torrance :

$$\eta = \frac{1 + \sqrt{F_0}}{1 - \sqrt{F_0}}$$

$$c = \mathbf{v} \cdot \mathbf{h}$$

$$g = \sqrt{\eta^2 + c^2 - 1}$$

$$F_{Cook-Torrance}(\mathbf{v}, \mathbf{h}) = \frac{1}{2} \left(\frac{g - c}{g + c} \right)^2 \left(1 + \left(\frac{(g + c)c - 1}{(g - c)c + 1} \right)^2 \right)$$

Fresnel Reflectance Table:

X : Angle R

Y: Reflectance

 F_0 : start point

Fresnel : trend

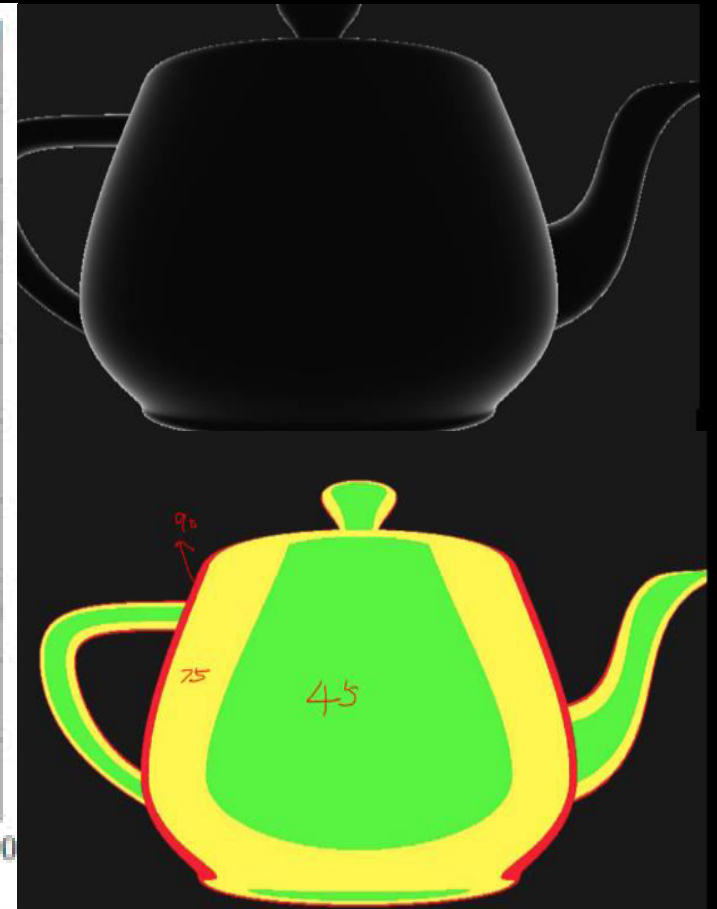

Fresnel
Reflectance

Image from "Real-Time Rendering, 3rd Edition", A K Peters 2008

Porosity:

The ratio of the pore's volume to the total volume

范围在0到1之间，即为0到100%之间。

Porosity's role:

to describe the influence from the water

1. Darken Albedo
2. Change Glossiness
3. Boost reflectance

Physically Based Sensitising

Two types of sensor :

1. CMOS, CCD
2. Eye

Difference:

1. Angle of view
2. Dynamic range
3. Resolution

Angle of view

CMOS/CCD

the focal length of the lens

EYE

Multiple factors:

1. a focal length of approximately 22 mm
2. The overlapping region of both eyes is around 130°
3. central angle of view — around $40\text{--}60^\circ$
4. close to a 50 mm focal length lens

ANGLE OF VIEW AND FOCAL LENGTH

Dynamic range :

the ratio between the largest to smallest possible values of a changeable quantity.

Eye » CMOS/CCD

RESOLUTION & DETAIL

CCD/CMOS: Symmetrical

Eye: Prioritized based on interest, and asymmetrical

CCD/CMOS	Eye - interest	Eye - asymmetrical
Symmetrical	contrast, sharpness, uniqueness, motion.....(red part)	the central part of eyes' resolution is much higher than at the edges
		

Physically Based Sensitising --》CMOS/CCD

Two procedures to simulate the imaging

1. Exposure

2. HDR TONE MAPPING

The benefit

1. convenient, intuitive
2. Ready for the post processing(i.e. DOF, motion blur。 。 。 。 。)

表1. 曝光时间（单位秒），*在不同的曝光值和f值下

EV	f值												
	1.0	1.4	2.0	2.8	4.0	5.6	8.0	11	16	22	32	45	64
-6	60	2 m	4 m	8 m	16 m	32 m	64 m	128 m	256 m	512 m	1024 m	2048 m	4096 m
-5	30	60	2 m	4 m	8 m	16 m	32 m	64 m	128 m	256 m	512 m	1024 m	2048 m
-4	15	30	60	2 m	4 m	8 m	16 m	32 m	64 m	128 m	256 m	512 m	1024 m
-3	8	15	30	60	2 m	4 m	8 m	16 m	32 m	64 m	128 m	256 m	512 m
-2	4	8	15	30	60	2 m	4 m	8 m	16 m	32 m	64 m	128 m	256 m
-1	2	4	8	15	30	60	2 m	4 m	8 m	16 m	32 m	64 m	128 m
0	1	2	4	8	15	30	60	2 m	4 m	8 m	16 m	32 m	64 m
1	1/2	1	2	4	8	15	30	60	2 m	4 m	8 m	16 m	32 m
2	1/4	1/2	1	2	4	8	15	30	60	2 m	4 m	8 m	16 m
3	1/8	1/4	1/2	1	2	4	8	15	30	60	2 m	4 m	8 m
4	1/15	1/8	1/4	1/2	1	2	4	8	15	30	60	2 m	4 m
5	1/30	1/15	1/8	1/4	1/2	1	2	4	8	15	30	60	2 m
6	1/60	1/30	1/15	1/8	1/4	1/2	1	2	4	8	15	30	60
7	1/125	1/60	1/30	1/15	1/8	1/4	1/2	1	2	4	8	15	30
8	1/250	1/125	1/60	1/30	1/15	1/8	1/4	1/2	1	2	4	8	15
9	1/500	1/250	1/125	1/60	1/30	1/15	1/8	1/4	1/2	1	2	4	8
10	1/1000	1/500	1/250	1/125	1/60	1/30	1/15	1/8	1/4	1/2	1	2	4
11	1/2000	1/1000	1/500	1/250	1/125	1/60	1/30	1/15	1/8	1/4	1/2	1	2
12	1/4000	1/2000	1/1000	1/500	1/250	1/125	1/60	1/30	1/15	1/8	1/4	1/2	1
13	1/8000	1/4000	1/2000	1/1000	1/500	1/250	1/125	1/60	1/30	1/15	1/8	1/4	1/2
14		1/8000	1/4000	1/2000	1/1000	1/500	1/250	1/125	1/60	1/30	1/15	1/8	1/4
15			1/8000	1/4000	1/2000	1/1000	1/500	1/250	1/125	1/60	1/30	1/15	1/8
16				1/8000	1/4000	1/2000	1/1000	1/500	1/250	1/125	1/60	1/30	1/15

EV & post processing

Aperture --> Vignetting

Aperture --> DOF

speed--> motion blur

HDR Tone Mapping

1. Display image in 8 bit low dynamic range (0-1.0)
2. Choose the discarded part in high dynamic range
3. Keep the original gradient, contrast, detail as much as possible

Two Tone Mapping Curves

1. Reinhard
2. Filmic

$$L_{\text{Reinhard}} = \frac{x}{x+1}$$

Reinhard

$$L_{\text{Filmic}} = \frac{((x * (A * x + C * B) + D * E))}{(x * (A * x + B) + D * F))} - E/F$$

Filmic

Reinhard vs Filmic

Reinhard vs Filmic

Different method:

Tri-ace's film simulation:

Color Enhancement and Rendering in Film and Game Production:

Film Simulation for Video Games

Yoshiharu Gotanda

tri-Ace, Inc.

The influence of PBR:

1. Essence of PBR
2. Purpose of PBR
3. Significance of PBR

Essence of PBR

Standardization

Purpose of PBR

Automation

Purpose of PBR

Assembly line

Significance of PBR

Mass production, reduce costs, improve efficiency, quality assurance
